

## **BUILD A HEALTH INDEX EVALUATOR**

Measure the Health Index value based on the given inputs. You have to design a web page.

Below are the fields basically needed in the web page:

1. A text box (with its label) to enter the age
2. A list box 1 (with its label) for Pulse values along with its units
3. A text box (with its label) to enter the Blood Pressure values along with its units
4. Calculate button where processing happens
5. A text box to display Health Index value with its label

Measure the Health Index value as per medical regulations based on age, pulse & blood pressure values and display in the respective text box. Ensure to show the index ranges & observation. Also do necessary validations as needed to accept only valid data entered.

Tools to be used: HTML, CSS & JavaScript

Note:

1. Follow the standard process
2. Make your own UI design
3. Have as much usability features as needed
4. Do beautification of your choice
5. You may add any other flavors to this application as you need
